

AMECA **INFRA**

# We Build

Infra is all about improving and linking up roads to major highways, increasing railway coverage to enable smooth movement of goods and people around the country. Buildings such as high tech hospitals, schools and a state of the art mining Engineering University are all part of Infra's future strategy.

We hold to the view, that sharing knowledge is key to every successful collaborative venture. This includes teaching the people from the area new skills, giving emerging generations a great new start, and the country an excellent economically independent future.

Ports and bridges are all part of our green industrial holistic approach to creating a modern green mining operation.

AMECA **INFRA**

# We Develop

We care about improving fair trade and allowing renewable energy. Sri Lanka's warm sunny climate and tropical location is the perfect location and we can use it to provide sustainable long term energy for industry as well as regional development.

Although excellently developed in some areas of the Island, with the latest high tech highways, Sri Lanka in the more rural areas can hugely benefit from improved infrastructure for two key reasons: firstly, few countries have suffered quite so much misfortune and interference in the last four decades (resulting in setbacks to infrastructure progress) as Sri Lanka was devastated due to the 26 year civil war, the 2004 tsunami, the Easter bombings and several total lockdowns over the global Covid pandemic creating both a medical and financial crisis.

# We Grow

There is no faster way to reinvigorate and return national pride to people, whose ancient Kings led the world in feats of engineering brilliance than with a sustainable natural resources footprint, that will develop the island as a mining hub in dynamic and extremely exciting new ways.

Sri Lanka's economy, owing to such long term conflicts and lockdowns of one form or another, is at rock bottom, yet it is one of the most resource-rich countries, a true treasure island in the centre of the world with huge untapped reserves.

Project Wara will be a game-changing operation for the Island. It will tap into the island's vast potential for growth due to its rich supply of graphite, copper, iron and other minerals.

A photograph of a terraced agricultural field, likely a paddy field, showing rows of green crops growing in muddy water. The terraces are separated by low earthen walls. The image is partially covered by an orange banner at the top right.

# We Thrive

We realize that all Sri Lanka needs is a jump start. This will materialize by working collaboratively with both overseas and local experts to develop long term infrastructure for mining. Down stream added value processing, with associated accommodation will, alongside sustainable organic farming, serve to feed the work force.

AMECA is already employing local farmers to grow food for the entire community, while also providing transportation and education, and near future plan for building an eco friendly village.

This will include an additional green hotel whose accommodation will run entirely on solar which will provide everyone in the community with healthy monthly incomes.

Ameca Infra does more than just build, roads and buildings, we put hope for the future back into the hearts of our partnering communities.
